

- $c'(f_B) = \alpha = 1$ (derivative of low vaccine-distribution cost function)
- $c'(f_B) = \alpha = 2$ (derivative of high vaccine-distribution cost function)
- $c'(f_B) = \alpha = 4$ (derivative of very high vaccine-distribution cost function)
- ... f_A^* (optimal f_A for Country A when $f_B = 1$) and $g(f_A^*)$
