

max fraction of total vaccines
Country B will use, $f_B (= f_A)$

cost to Country B, C_B (log scale)

- Country A's cost-minimizing values of f_A
- Country B's cost-minimizing values of f_B
- overlap (Nash equilibria)

Regions of lower cost than Nash equilibrium
for both countries, with infrastructure
development costs for Country A...

- 25% as costly as for Country B
- 50% as costly as for Country B
- 100% as costly as for Country B
